Machine Learning in Power Grid Load-Forecasting

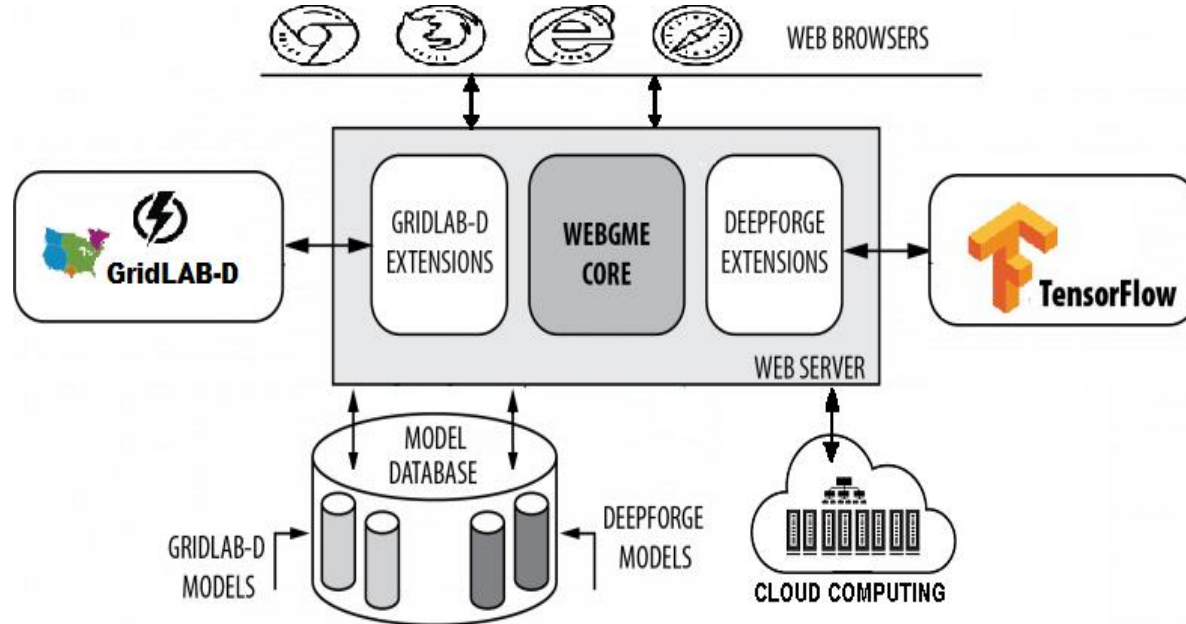

- Distributed Energy Resources (DER) integration makes grid controls highly dynamic and distributed
- Prosumers = Producers + Consumers
- Dynamic power pricing adds to complexity
- Traditional load forecasting becomes highly challenging
- Deep-learning based predictors using smart meter data is more manageable

PROBLEM: These neural network based load forecasters are vulnerable to stealthy adversarial attacks!

Motivation for the TeSER Testbed

- This testbed targets evaluation of potential vulnerabilities and successful resilient strategies for complex Cyber-Physical Systems (initially in the power-grid domain). Although adversarial machine learning is not new, it's application in the context of security and resilience of CPS is novel.
- In power-grid, traditional load forecasting doesn't work well with highly dynamic variations in smart grid topology (e.g., bidirectional power flow) and power supply and demand (e.g., DERs and time of use rate). Here, it would require updating models continuously, which is not practical.
- Machine-learning methods can handle these, but suffer from black-box problem. Also, modern grid now has much higher digital connectivity among grid and control equipment. These two makes ML methods susceptible to adversarial attacks. So, we need a testbed that can help with evaluating vulnerabilities and successful resilient strategies.
 - Another key motivation for this testbed is to support a web-based, collaborative, model-based approach that can enable rapid prototyping and experimentation with various neural network architectures and data processing, training and evaluation pipelines.
 - TeSER also aims to support tight integration with the CPS simulation tools – such as GridLAB-D – which further simplifies the process and shortens the time for input data generation for such models.
 - **Note:** All of the testbed tools and technologies are largely domain-independent. So, these methods can be directly utilized in other CPS application domains such as transportation, biomedical, defense, etc.

TeSER: Testbed for Simulation-Based Evaluation of Resilience

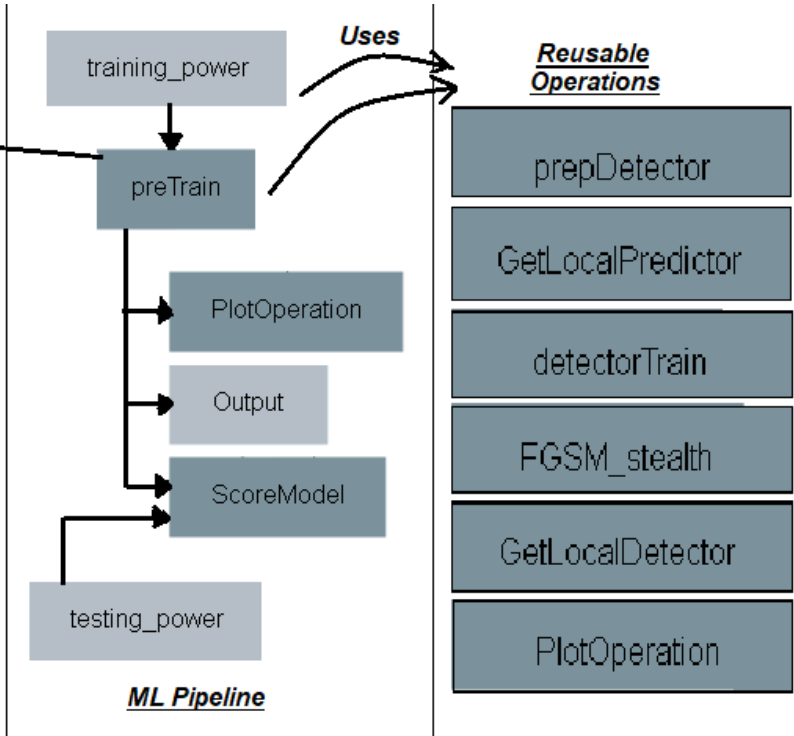

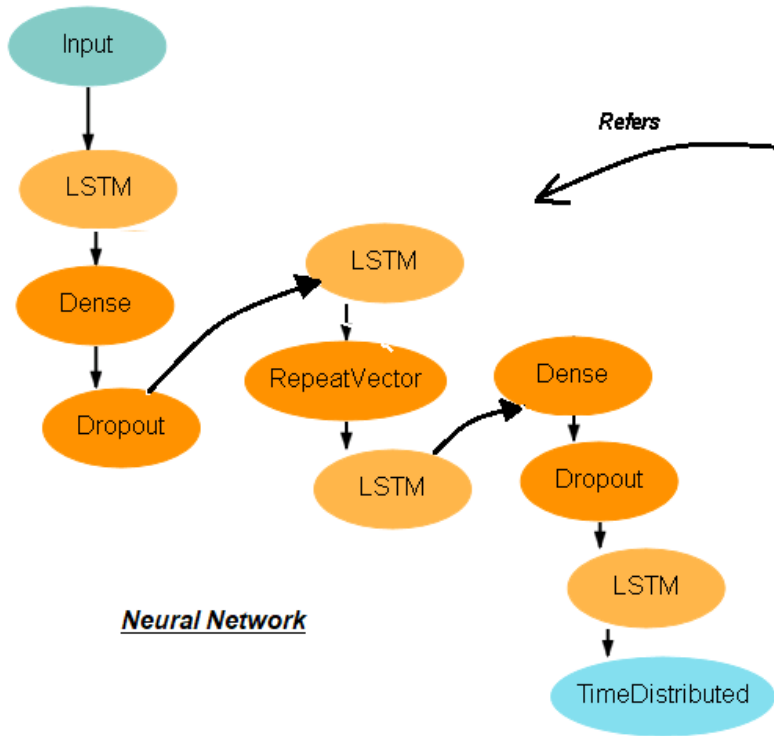

TeSER Testbed Architecture

Web-accessible, Collaborative,
Cloud-Supported

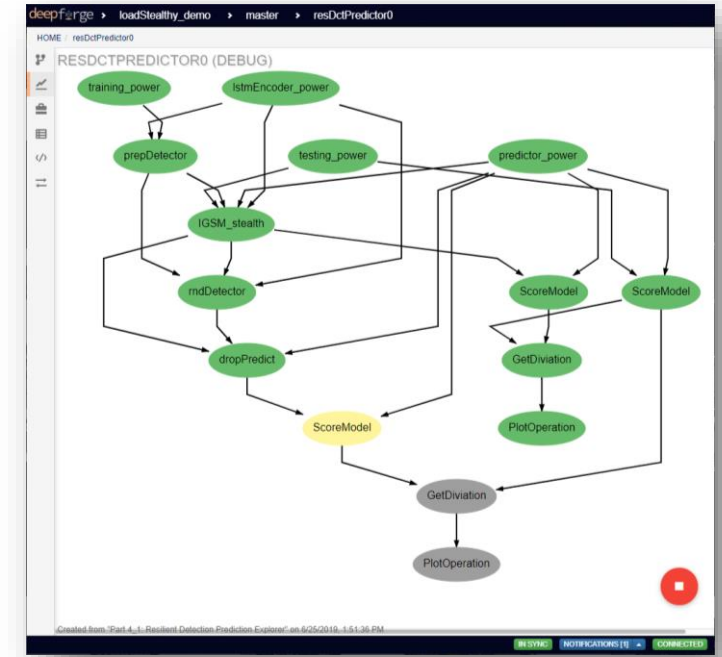

TeSER Testbed (requires
password)
<https://lablet.webgme.org>

- Built using four “open-source” technologies:
 - **WebGME** (Web-based Generic Modeling Environment): Meta-modeling environment for creating rich domain-specific modeling languages
 - **GridLAB-D**: Power grid distribution systems steady-state simulator
 - **DeepForge**: Deep Learning Framework
 - **MongoDB**: Object-oriented database
- Integrated cloud computation platform for executing large-scale experiments
- Integrated support for modeling various Tensorflow/ Keras based machine learning architectures
- Supports storage of experiment results and presenting as digestible plots
- Full versioning and change-tracking of all models
- Full record of executed ML pipelines: iterations, console logs, etc.

Distribution Grid M&S

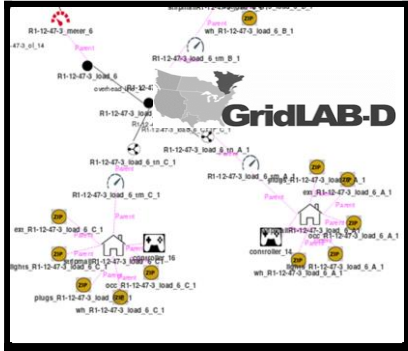

Evaluating Adversarial Attack Impact on Grid Forecasters

Ex 1: Comparing Deep Learning Based Load Predictors

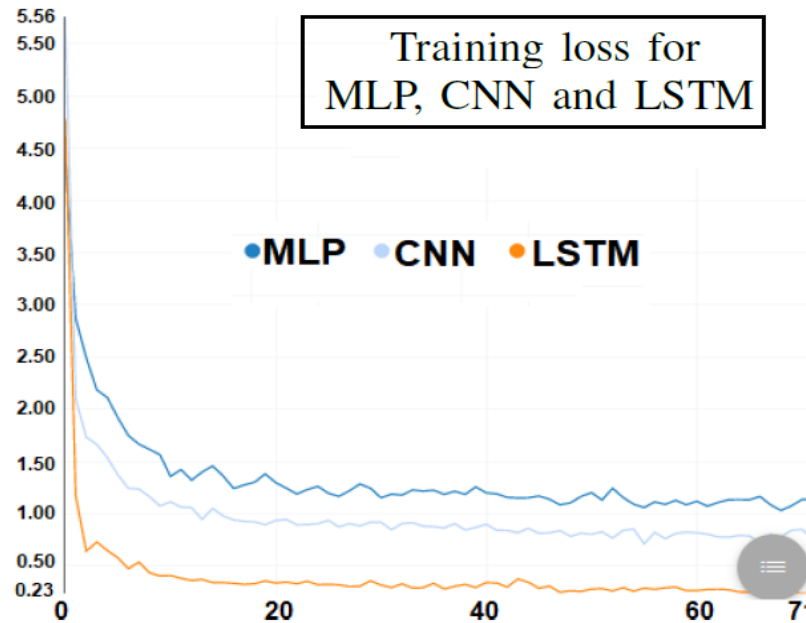

Medium scale feeder in GridLAB-D (109 smart meters)

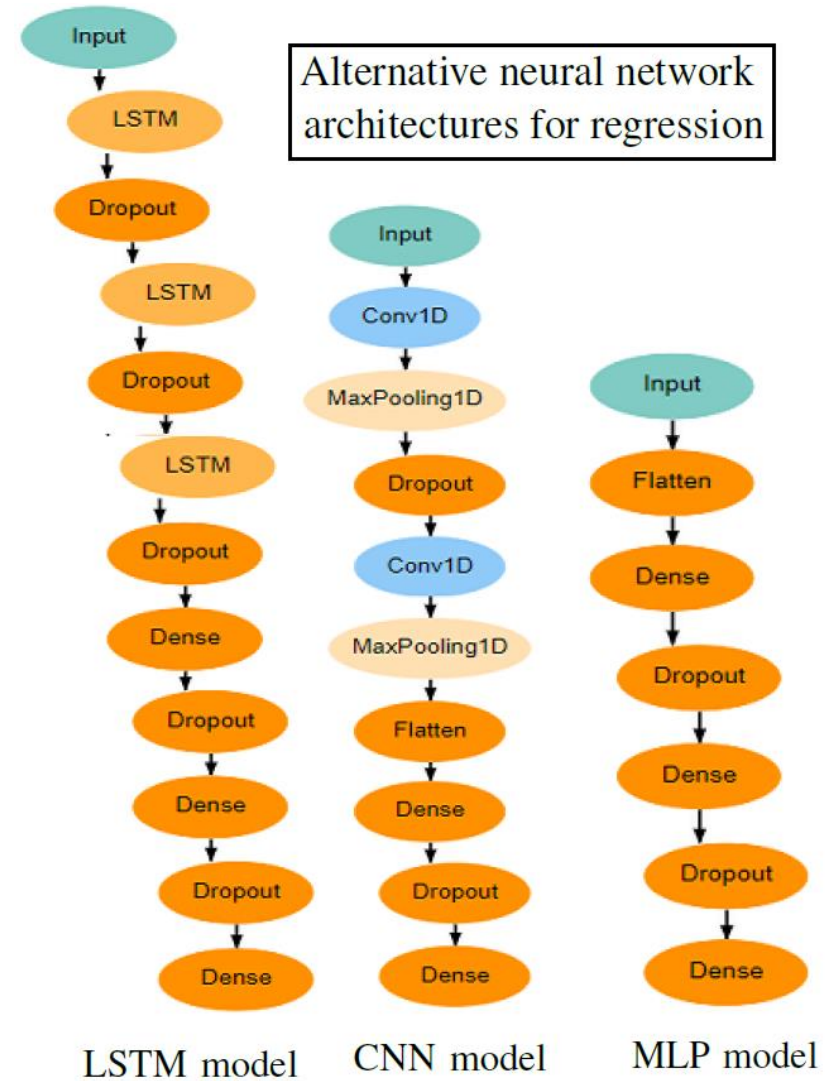

Pipeline model for training predictors

Training loss for MLP, CNN and LSTM

Alternative neural network architectures for regression

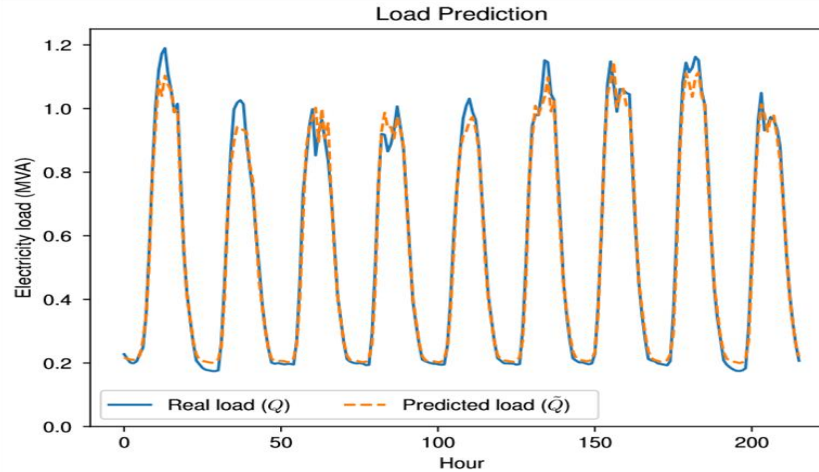

Ex2: Load Predictions under Stealthy Adversarial Attacks

- Medium scale feeder in GridLAB-D (109 smart meters)

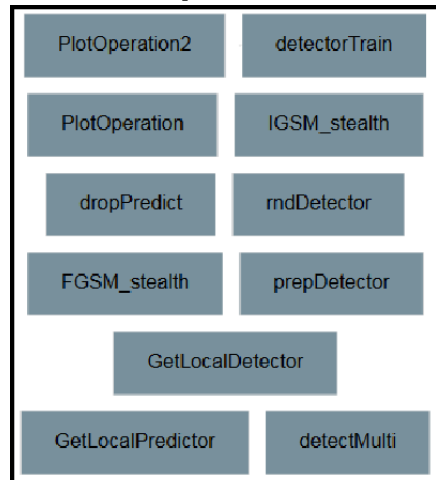

- LSTM load forecast predictor
- Auto-encoder anomaly detector

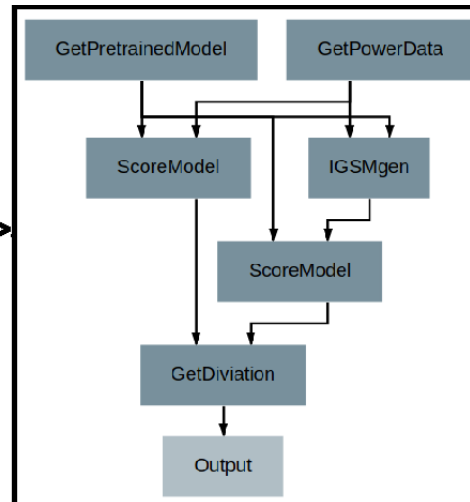

- Threat constraints: 30% of sensors compromised, each modified no more than 20%
- Assume worst-case **white-box** attacks (i.e., full knowledge of predictor and anomaly detector)

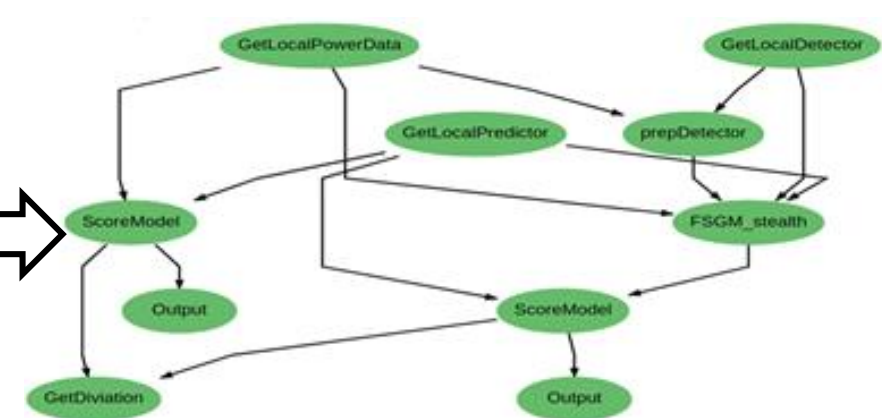

Reusable Operations in TeSER

ML Pipelines in TeSER

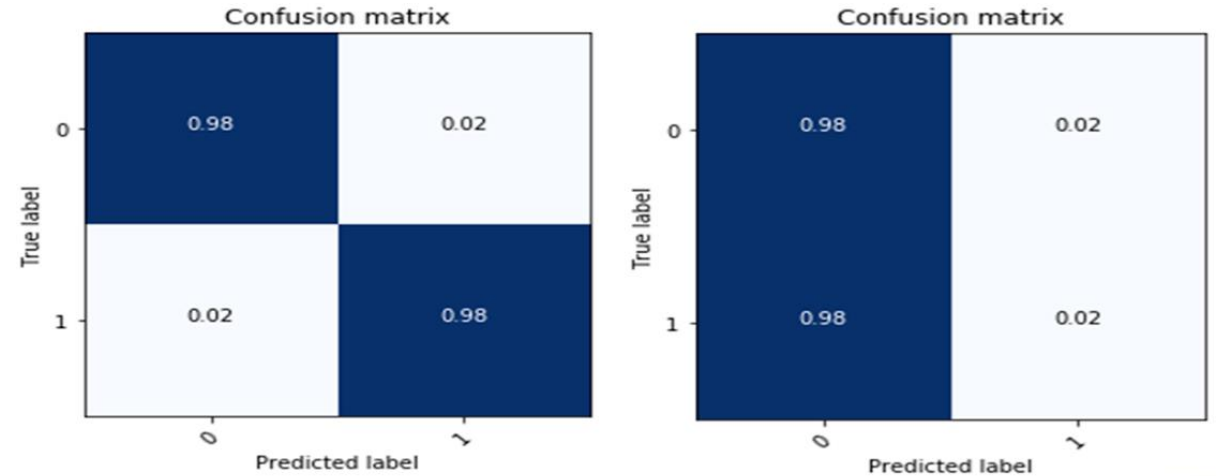

ML Pipelines "Executions" in TeSER

Ex2: Experiment Results

Four adversarial attack settings:

- **Fast Gradient Sign Method (FGSM):** Single step attack to maximize the prediction deviation from the original predictor
- **Iterative GSM:** Iterative attack to maximize the prediction deviation from the original predictor
- **Directed GSM (reverse = 1):** Iterative attack to minimize the predicted values
- **Directed GSM (reverse = -1):** Iterative attack to maximize the predicted values

Prediction Results (MSE) with Different Prediction Deployment Settings

Attack/Detection Settings	Original/NoAttack	Adversarial/NoDetect	Original/StaticDetect	Adversarial/StaticDetect
Fast-GSM (rate=0.3,step_len=0.2)	0.1255	0.5375	0.1287	0.5322
Iterative-GSM (rate=0.3, step_len=0.01,step_num=20)	0.1255	0.7801	0.1287	0.7606
DirectedGSM (rate=0.3, step_len=0.01,step_num=20, reverse=1)	0.1255	0.4785	0.1287	0.4913
DirectedGSM (rate=0.3, step_len=0.01,step_num=20, reverse=-1)	0.1255	1.025	0.1287	0.9899
